

Web3 research your agent can build from.

Source equations. Author-stated limitations.

Missing assumptions in protocol design

THE DECISION GAP

Paper discovery

Manual math and
assumption checking

Implementation choice

The missing detail is often the assumption that breaks the design.

Teams building Web3 protocols.

PROTOCOL DESIGN QUESTIONS

DeFi and MEV
Compare incentives

ZK developers
Inspect prover assumptions

Wallet teams
Check account abstraction
security conditions

Source evidence inside the agent workflow.

One MCP connection for Codex, Claude,
and other compatible clients.

A BOUNDED RESEARCH WORKFLOW

- 01 Find relevant work
- 02 Read the source section
- 03 Retrieve formulas, code,
or stated limitations
- 04 Compare evidence and
record a reading

Original equations with their assumptions.

BEV AUCTION MODEL / EQUATION 4

$$b_i^{\text{PA}}(\mathcal{O}, S_i) = (n - 1)/n \times R_i(\mathcal{O})$$

$$b_i^{\text{PA}}(\mathcal{O}, S_i) = \frac{n-1}{n} R_i(\mathcal{O})$$

Assumes uniform rewards and known participant count.

Readable notation above. Exact source LaTeX below.

Design limits from the authors.

**EntryPoint
concentrates risk.**

**Hijacking and
fee draining matter.**

**Authors call for
auditing and formal
verification.**

A retrieved warning, not a dtox security audit.

Research tools meet the agent workflow.

MCP

Research tools can be called from the agent clients developers already use.

x402

An optional payment route can be tested for heavier machine requests. dtox has a Solana devnet demonstration.

Research works without a wallet. Payments are optional.

A working corpus.

17,365

Web3 research records

180,833 total documents

10,801,846 structural chunks

3,388,455 citation edges

A maintained Web3 corpus, organized for source retrieval.

MIXED FULL-TEXT AND ABSTRACT RECORDS

PUBLIC COUNTERS / 2026-10-05 09:30 UTC

Web3 implementation evidence.

SERVICE	PRIMARY WORKFLOW	SCOPE
Semantic Scholar	Discovery, metadata, citations	Broad scholarly discovery
Elicit	Literature synthesis, extraction, API and MCP	Research engines across disciplines
arxiv-mcp-server	Original LaTeX reading, topic watches	arXiv-focused workflows
dtox research	Web3 papers, specs, equations, constraints	Implementation evidence across Web3 research and specs

Differentiation is the corpus and workflow.

Research stays off-chain. Attribution does not.

WHAT THE CHAIN CAN SHOW

Wallet-signed readings can be anchored with Solana Attestation Service.

Signature proves authorship, not truth or independence.

CHAIN STATUS

Solana Devnet demonstrated

Base, Ethereum, Arbitrum
Configured testnets. E2E pending.

No mainnet claim.

Free discovery. Paid depth is the hypothesis.

BEACHHEAD

Protocol teams and agent frameworks.

Next: recruit design partners. Measure repeat use and willingness to pay.

PROPOSED MODEL / PUBLIC BETA REMAINS FREE

TODAY

Public MCP research beta is free.

CANDIDATE MODEL

Optional credits or x402 for heavier usage and team integrations.

Daniyar Gabdullin

SOLO FOUNDER / ALMATY, KAZAKHSTAN

**Independent mobile, Web3, and AI
product work since 2019.**

**Blockchain, dApp, and wallet QA
experience since 2020.**

**Built and shipped Seeker Vault and X-Booster
/ Aibat for the Solana Seeker dApp Store.**

Bring a Web3 design question. Test it with your agent.

CODEx MCP SETUP

```
codex mcp add dtos --url https://read.whoim.space/mcp
```

```
read.whoim.space/research/ / github.com/who1900/dtos-research
```

PUBLIC MCP / READ.WHOIM.SPACE/MCP

Source coverage and evidence boundaries.

**Full text varies
by record.**

Abstract-only fallbacks remain possible.

**Empty results do not establish
novelty.**

Patents are outside the index.

Exact LaTeX only when sourced.

The platform predates the contest.

PLATFORM STARTED / JULY 31 2026

Crypto World's Fair began September 14, 2026.

During the contest: signed Solana attestations, devnet x402 settlement, hierarchical retrieval, and a Web3 evidence demo.

The platform's pre-contest history is disclosed.

DATES AND SCOPE FROM THE PUBLIC PROJECT SUBMISSION
